1 Miscellaneous

1.1 Default code

```
#include <bits/stdc++.h>
#define _ ios_base::sync_with_stdio(0);cin.tie(0);
#define FOR(i,a,b) for (int i=(a);i<(b);i++)
#define SZ(x) ((int)(x).size())
using namespace std;
```

1.2 C++ input/output

```
#include <iostream>
#include <iomanip>

using namespace std;

int main()
```

```
{
    // Output a specific number of digits past the decimal point,
    // in this case 5
    cout.setf(ios::fixed); cout << setprecision(5);
    cout << 100.0/7.0 << endl;
    cout.unsetf(ios::fixed);

    // Output the decimal point and trailing zeros
    cout.setf(ios::showpoint);
    cout << 100.0 << endl;
    cout.unsetf(ios::showpoint);

    // Output a '+' before positive values
    cout.setf(ios::showpos);
    cout << 100 << " " << -100 << endl;
    cout.unsetf(ios::showpos);

    // Output numerical values in hexadecimal
    cout << hex << 100 << " " << 1000 << " " << 10000 << dec << endl;
}
```

1.3 STL stuff

```
// Example for using stringstream and next_permutation

#include <algorithm>
#include <iostream>
#include <sstream>
#include <vector>

using namespace std;

int main(void){
    vector<int> v;

    v.push_back(1);
    v.push_back(2);
    v.push_back(3);
    v.push_back(4);

    // Expected output: 1 2 3 4
    //                  1 2 4 3
    //                  ...
    //                  4 3 2 1
    do {
        ostringstream oss;
        oss << v[0] << " " << v[1] << " " << v[2] << " " << v[3];

        // for input from a string s,
        // istream iss(s);
        // iss >> variable;

        cout << oss.str() << endl;
    } while (next_permutation (v.begin(), v.end()));

    v.clear();

    v.push_back(1);
    v.push_back(2);
    v.push_back(1);
    v.push_back(3);

    // To use unique, first sort numbers. Then call
    // unique to place all the unique elements at the beginning
    // of the vector, and then use erase to remove the duplicate
    // elements.

    sort(v.begin(), v.end());
    v.erase(unique(v.begin(), v.end()), v.end());

    // Expected output: 1 2 3
    for (size_t i = 0; i < v.size(); i++)
        cout << v[i] << " ";
    cout << endl;
}
```

1.4 Priority Queue

```
// priority queue having minimum at top

#include <queue>,<functional>
priority_queue< T, vector<T>, greater<T> > pqueue;

// priority queue with custom comparing function
#include <queue>
struct cmp {
    bool operator () (const int a, const int b) {
        return ((a)<(b));
    }
};
priority_queue<int, vector<int>, cmp> q;
```

1.5 Dates (Java)

```
// Example of using Java's built-in date calculation routines

import java.text.SimpleDateFormat;
import java.util.*;
```

```

public class Dates {
    public static void main(String[] args) {
        Scanner s = new Scanner(System.in);
        SimpleDateFormat sdf = new SimpleDateFormat("M/d/yyyy");
        while (true) {
            int n = s.nextInt();
            if (n == 0) break;
            GregorianCalendar c = new GregorianCalendar(n, Calendar.
                JANUARY, 1);
            while (c.get(Calendar.DAY_OF_WEEK) != Calendar.SATURDAY)
                c.add(Calendar.DAY_OF_YEAR, 1);
            for (int i = 0; i < 12; i++) {
                System.out.println(sdf.format(c.getTime()));
                while (c.get(Calendar.MONTH) == i) c.add(Calendar.
                    DAY_OF_YEAR, 7);
            }
        }
    }
}

```

2 Graph algorithms

2.1 Fast Dijkstra's algorithm - Stanford

```

// Implementation of Dijkstra's algorithm using adjacency lists
// and priority queue for efficiency.
//
// Running time: O(|E| log |V|)

#include <queue>
#include <cstdio>

using namespace std;
const int INF = 2000000000;
typedef pair<int, int> PII;

int main() {
    int N, s, t;
    scanf("%d%d%d", &N, &s, &t);
    vector<vector<PII>> edges(N);
    for (int i = 0; i < N; i++) {
        int M;
        scanf("%d", &M);
        for (int j = 0; j < M; j++) {
            int vertex, dist;
            scanf("%d%d", &vertex, &dist);
            edges[i].push_back(make_pair(dist, vertex)); //
                note order of arguments here
        }
    }

    // use priority queue in which top element has the "smallest"
    // priority
    priority_queue<PII, vector<PII>, greater<PII>> Q;
    vector<int> dist(N, INF), dad(N, -1);
    Q.push(make_pair(0, s));
    dist[s] = 0;
    while (!Q.empty()) {
        PII p = Q.top();
        Q.pop();
        int here = p.second;
        if (here == t) break;
        if (dist[here] != p.first) continue;

        for (vector<PII>::iterator it = edges[here].begin(); it
            != edges[here].end(); it++) {
            if (dist[here] + it->first < dist[it->second]) {
                dist[it->second] = dist[here] + it->
                    first;
                dad[it->second] = here;
                Q.push(make_pair(dist[it->second], it->
                    second));
            }
        }
    }

    printf("%d\n", dist[t]);
    if (dist[t] < INF)
        for (int i = t; i != -1; i = dad[i])
            printf("%d%c", i, (i == s ? '\n' : ' '));

    return 0;
}

/*
Sample input:
5 0 4
2 1 2 3 1
2 2 4 4 5
3 1 4 3 3 4 1
2 0 1 2 3
2 1 5 2 1

Expected:
5
4 2 3 0
*/

```

2.2 Eulerian path - Stanford

```

struct Edge;
typedef list<Edge>::iterator iter;

struct Edge {
    int next_vertex;
    iter reverse_edge;

    Edge(int next_vertex) : next_vertex(next_vertex) {}
};

const int max_vertices = ;
int num_vertices;
list<Edge> adj[max_vertices]; // adjacency list

vector<int> path;

void find_path(int v) {
    while (adj[v].size() > 0) {
        int vn = adj[v].front().next_vertex;
        adj[vn].erase(adj[v].front().reverse_edge);
        adj[v].pop_front();
        find_path(vn);
        path.push_back(v);
    }
}

void add_edge(int a, int b) {
    adj[a].push_front(Edge(b));
    iter ita = adj[a].begin();
    adj[b].push_front(Edge(a));
    iter itb = adj[b].begin();
    ita->reverse_edge = itb;
    itb->reverse_edge = ita;
}

```

2.3 Bellman Ford (Shortest path with negative edges)

```

// Time Complexity: O(V * E)
// Input: ne, nv, src, end, edges[N] (list of edges)
// Output: Shortest path from src to every vertex on the graph (iff
//         bellman_ford() returns 0. 1 means negative cycle)

#define N 1000
struct Edge {
    int u, v, w;
};
int nv, ne, src, d[N];
Edge edges[N];
int bellman_ford() {
    memset(d, 0x3f, sizeof(d));
    d[src] = 0;
    for (int i=0; i < nv-1; i++)
        for (int j=0; j < ne; j++)
            if (d[edges[j].u] + edges[j].w < d[edges[j].v])
                d[edges[j].v] = d[edges[j].u] + edges[j].w;

    for (int i=0; i < ne; i++)
        if (d[edges[i].u] + edges[i].w < d[edges[i].v])
            return 1;

    return 0;
}

```

2.4 Floyd-Wrashall (All-pairs shortest path)

```

// Time Complexity: O(N^3)
// Input: cost (adjacency matrix with cost)
// Output: Shortest path between all pair of nodes

#include <algorithm>
#define FOR(i,a,b) for(int i=(a); i<(b); i++)
#define N 100
int path[N][N], cost[N][N];
void FloydWarshall() {
    FOR(i,0,n) FOR(j,0,n) path[i][j] = cost[i][j];
    FOR(k,0,n) FOR(i,0,n) FOR(j,0,n)
        path[i][j] = min(path[i][j], path[i][k]+path[k][j]);
}

```

2.5 Prim (MST)

```

//Complexidade: O(E log V)
//Dados iniciais: pair<distancia, vertice> na lista de adjacencia
//Dados finais:
// d[v] -> distancia da aresta que liga a MST ao vertice v
// parent[v] -> vertice a que esta ligado o vertice v
// totalweight -> peso total da arvore

#include <vector>, <set>
#define NVERTICES 10010
vector< pair<int,int> > adjlist[NVERTICES];
set< pair<int,int> > heap;

```

```

int d[NVERTICES], parent[NVERTICES], totalweight;
void add(int cost, int v, int p) {
    if(cost<d[v]) {
        parent[v]=p;
        heap.erase(pair<int,int>(d[v], v));
        d[v]=cost;
        heap.insert(pair<int,int>(d[v], v));
    }
}

void prim(int root) {
    memset(d, 0x3f, sizeof(d)); // 0x3f3f3f3f > 1.000.000.000
    memset(parent, -1, sizeof(parent));
    totalweight=0;
    add(0, root, -1);
    while(!heap.empty()) {
        pair<int,int> cur = *heap.begin();
        totalweight+=d[cur.second];
        d[cur.second]=0; //vertex in MST
        heap.erase(heap.begin()); //pop closest vertex
        for(unsigned int i=0; i<adjlist[cur.second].size(); i++) //for each neighbour
            add(adjlist[cur.second][i].first, adjlist[cur.second][i].second, cur.second); //add/refresh distance
    }
}

```

2.6 Kruskal - Stanford

```

/*
Uses Kruskal's Algorithm to calculate the weight of the minimum
spanning
forest (union of minimum spanning trees of each connected component) of
a possibly disjoint graph, given in the form of a matrix of edge
weights
(-1 if no edge exists). Returns the weight of the minimum spanning
forest (also calculates the actual edges - stored in T). Note: uses a
disjoint-set data structure with amortized (effectively) constant time
per
union/find. Runs in O(E*log(E)) time.
*/

#include <iostream>
#include <vector>
#include <algorithm>
#include <queue>

using namespace std;

typedef int T;

struct edge
{
    int u, v;
    T d;
};
